

Project Report

1. Introduction

During the Bootstrap course I took on a side project that included building a portfolio/resume website. Now I would like to take that design and use what I've learned in React to make it more efficient and user friendly.

2. User Interface Design and Prototype

Here are some screenshots of my current portfolio site and the URL is in the references below:

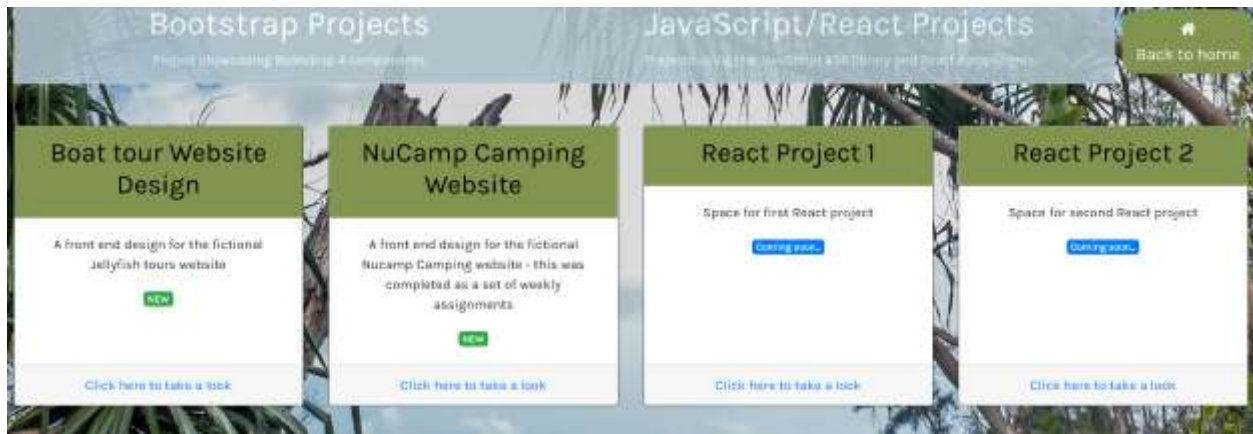

Landing Page

Resume Page

List of Portfolio Projects

3. Navigation Structure

I'll obviously want to restructure this so the layout is more consistent/user friendly, and also I will have the resume and list of projects all on a single page.

I will be using the walkthrough guide in the references as a starting point, which I will then build on in order to personalize the site to my own tastes.
